

**Math 32404: Advanced Calculus II**  
**Reading exercises 4, due on Monday, October 30th.**

Read section 39 in our textbook, including the exercises in the textbook, and solve the exercises below as you go along. **In addition, review single-variable sections 27-28 as necessary.** Your solutions will not be collected, but a very short in-class quiz on the due date will contain one of these exercises, or one very very similar to it.

1. Let  $f(r, s, t) := (r \cos s \sin t, r \sin s \sin t, r \cos t)$ .
  - (a) Compute the 9 partial derivatives of  $f$ .
  - (b) Evaluate  $f(2, 0, \pi/2)$  and the Jacobian matrix representing the derivative of  $f$  at  $(2, 0, \pi/2)$ .
  - (c) Find some  $\delta > 0$  that satisfies the definition of “ $f$  is differentiable at  $(2, 0, \pi/2)$ ” for  $\epsilon = .01$ .
  - (d) At what points in  $\mathbb{R}^3$  is the Jacobian determinant of  $f$  non-zero?
2. Write out the proof of Theorem 39.9 in full generality, that is, without assuming that  $q = 1$ . Exercise 39.V may be helpful - but prove it before using it!
3. Solve at least two of exercises 39.A - H.
4. Compute at least one item from each of the exercises 39.O, 39.Q, and 39.S.
5. Verify at least one of the exercises 39.N, 39.P, and 39.R.
6. (\*)Find proofs of all parts of Theorem 27.9 in books, or write down your own.
7. (\*)Let  $f_n(x) := x^n$  for each  $n = 1, 2, 3, \dots$ . For what intervals  $J \subset \mathbb{R}$  does Theorem 28.5 apply to this sequence of functions? Compute everything mentioned in the theorem and its proof for this sequence of functions for the interval  $[-0.1, 0.7]$ ; and also for the interval  $[-1.7, 1.7]$ .
8. (\*)Do one of exercises 28.K and 28.L.

(\*) These will not appear on the quiz, problem set, or test. However, our next topic is multivariable versions of these.
